

## EXECUTIVE NOTE: DEATH, WEAPONS, AND AMERICA'S HUMANITARIAN IMPERATIVE

6 February 2013

By Jeff Moran | Geneva

Lawmakers and policymakers should consider the humanitarian imperative with respect to curbing violence in America in the weeks and months ahead. To do this, recognition must be given to relevant data and analysis. Rightly understood, the problem is not a gun availability or gun choice problem as much as it is an individual behavioral choice problem. Legislation and policies should reflect this. Analysis of relevant FBI data published by the Criminal Justice Information Service Division and CDC data published in the Web-based Injury Statistics Query and Reporting System illustrate why.

Here are five high-level findings from the FBI data with respect to American homicides and weapons use from 2006-2010 (See Exhibit 1 for reference table):

1. The share of homicides due to all types of firearms has not increased, it has actually decreased. This contrasts with the fact that homicides due to sharp objects, blunt objects, and the human body have each increased over time.
2. The sharp object (e.g. a knife) is the 2nd most lethal weapon in the United States. The sharp object is used in 13% of all homicides, and its share of all homicide is up.
3. The human body (e.g. hitting, pushing, kicking) is the 5th most lethal weapon in the United States. The human body is the cause of death for 6% of all homicides, and its share of all homicide is up.
4. The blunt object (e.g. hammer, club) is the 6th most lethal weapon in the United States. The blunt object is used in 4% of all homicides, and its share of all homicide is up.
5. The rifle and shotgun are the 7th & 8<sup>th</sup> most lethal weapons respectively. The rifle and shotgun are each used in 3% of all homicides, and their share of all homicide is down.

Here are ten high-level findings from CDC data with respect to gun related homicides, suicides, and accidents from 1993-2009 (See Exhibits 2-9 for reference charts and tables):

1. The rates of gun-related homicide, suicide, and accidental death have decreased by 44%, 19%, and 69% respectively since 1993 (for all races, ages).
2. After declining substantially over 10 years, gun suicides rates have significantly increased each year since 2006 (for all races, ages).
3. Since 1993 the rate of gun suicides has been higher than both gun homicides and accidental gun deaths combined (all races, ages).
4. The ratio of gun suicides to gun homicides for white Americans is 3.1 to 1 and is the highest across all races with whites aged 15-34 being most at risk.
5. Americans aged 15-24 are the most at risk for gun homicide but the ratio of gun homicides to accidental deaths for this group was just 1 to 3 (all races).
6. The majority of American gun homicides (54%) take the lives of black Americans, who constitute less than 14% of the total population.
7. Homicide is the leading cause of death only for black Americans aged 15-34, with 87.4% of all homicides for this group caused by guns.

8. The ratio of gun homicides to gun suicides for black Americans is over 6.1 to 1, but for non-black Americans it is just 1 to 3 (nearly a 20X difference).
9. The ratio of gun homicides to deaths from flu/pneumonia for black Americans is 1.1 to 1, for non-black Americans, it is just 0.1 to 1 (a 10X difference).
10. The ratio of gun homicides to accidental death not due to firearms for black Americans is .50 to 1, for non-black Americans, it is just .05 to 1 (a 10X difference).

Here are six implications:

1. The share gains of non-firearms and share losses of firearms within the “homicide market” from 2006-2010 suggests the “guns and gun availability is the problem now” hypothesis is invalid.
2. Legislative proposals that focus on banning certain types of firearm, especially rifles and shotguns, do not appear to be warranted since such weapons are decreasingly used and demonstrably less lethal than sharp objects, blunt objects, or the human body across civil society as a whole.
3. The problem is not universal and solutions should not be either. What is needed are tailored approaches, customized to the most at risks individuals. With respect to firearms, this would be whites aged 15-34 at risk of suicide, and blacks aged 15-34 at risk of homicide.
4. That the human body is demonstrably more lethal in American civil society than rifles and shotguns combined clearly means that banning certain semi-automatic long-arms will have little if any impact on homicides nationally.
5. The root cause of homicide is an individual behavior and choice issue, and clearly not just a gun availability or gun choice issue. Policy responses should be focused more on incentivizing or nudging individuals away from the choice to kill well before they consider their weapon.
6. Politicians would be well advised to look deeper at the problem of homicide, look upstream as to the causes, and prioritize efforts to develop result-focused behavioral intervention strategies over weapons access or weapons choice removal strategies.

Here are four key take-aways for lawmakers and policymakers:

1. Pursuing policies like universal background checks and gun bans are not advisable. Such one-size-fits-all policies could be highly vulnerable to judicial invalidation aside from being practically off-target. Broad policies would likely have little if any significant net impact on those most at risk.
2. Policy decided or chosen without reasonable grounds or a rational connection to facts, let alone without appropriate respect for the implications of [strict scrutiny](#) and [enumerated rights](#), would likely be successfully challenged as arbitrary, capricious, and unconstitutional.
3. Lawmakers should therefore carefully temper their response to recent American tragedies. From a humanitarian viewpoint, it is recommended lawmakers insist on rigorous analysis of relevant data to focus, and to set policy by starting with desired outcomes and planning backwards.
4. Analysis of CDC and FBI data suggests the highest priority is for new and improved laws addressing undesirable resort to violence within American civil society, not guns. Policy making should entail targeting, tailoring, and customizing policies, outreach, civic organizing and engagement of the most at-risk individuals: black and white Americans aged 15-34 years.

In conclusion, misreading American violence as a weapons access or weapons choice issue dangerously ignores the primary human variable in violence, and would result in a shameful humanitarian loss.

**Author:** Jeff Moran studies international humanitarian law and human rights at The Geneva Academy in Switzerland. He will complete his executive LL.M. focused on international weapons law and disarmament later this year. Mr. Moran is formerly a military diplomat, aerospace/defense industry marketing leader, and independent consultant to firearms distributors. Mr. Moran has a Bachelor of Science in Foreign Service from Georgetown University, an MBA from Emory University, and an Executive Master in International Negotiations & Policy Making from The Graduate Institute of International and Development Studies in Geneva.

**Contact:** You may contact the author via email : [jeff.moran@geneva-academy.ch](mailto:jeff.moran@geneva-academy.ch)

**Disclosure:** This note is not an official publication and is not intended as legal counsel. The views in this note are the author's and do not necessarily represent The Geneva Academy. The author wrote this note independently without any financial assistance or special remuneration from any individual or organization.

**Distribution:** This note and any information herein may be freely distributed and used as long as Jeff Moran is properly credited as the author.

**About The Geneva Academy:** The Geneva Academy of International Humanitarian Law and Human Rights aims to provide instruction of a high academic standard, in French and in English, conduct and promote scientific research, organise training courses and expert meetings and provide legal expertise in the branches of international law relating to situations of armed conflicts.
